

Project: Summarise Alerts with A.I.

Prepared by Mallikah Sharp

Introduction: To simulate a real SOC process where a SIEM alert triggers a workflow that summarises the alert using A.I and then sends the email summary to alert the team. This project tackles a common SOC challenge: **alert fatigue**. Analyst often spend too much time sorting through raw alerts, which delays response. To improve efficiency, I integrated Elastic SIEM with Tines to automate enrichment and used AI summarization to produce clear, actionable alerts delivered by email.

Required Tools & Accounts:

- Tines Account
- A free SIEM account: **Elastic Basic**

Summary of what I did:

SIEM Setup: In the chosen SIEM, create a simple detection rule (e.g., "Admin Failed to Login"). Show how to configure this rule to fire a **webhook** as its action. This is a critical step.

Trigger Setup: In Tines, set up a Webhook Trigger and show how to copy the URL into the SIEM's webhook configuration. Fire a test alert to see the data arrive in Tines.

Trigger the Alert: Show how to trigger the alert so that the Tines workflow executes.

End-to-End Test: Trigger the alert in the SIEM and watch the entire workflow execute, culminating in the alert being summarised by the A.I tool and sending an email alert notification.

Step 1: In Elastic, click add agent, Custom create and add a name, Configure to Windows, Copy and paste the command in PowerShell (Run as Administrator), You will then see the agent is enrolled and incoming data confirmed

Agent enrollment confirmed

✓ 1 agent has been enrolled.

[View enrolled agents](#)

Incoming data confirmed

✓ Incoming data received from 1 of 1 recently enrolled agent.

Step 2: Click the host name, click “add Integration”, Find “elastic defend” and add it. Create a new rule. Click continue for steps 2 and 3 without changing anything. Then when you get to Rule Action 4, Click “Webhook” to define the data that will be sent to Tines.

Step 3: Go to “Create connector”. Copy and paste the Tines Webhook URL and save

Step 4: Go to Tines, sign up and then create “New”. Drag to the middle of the page, “Web hook”, “AI” and “Send emails”. Make sure to connect them.

Step 5: Go back to Elastic and post the tines webhook link in the “Edit Connector”.

Connectors

Connect third-party software with your alerting data.

Step 6: Go to “Rules” and choose “Detection Rules”. Click the blue button “Create new rule”. Click on “Custom Query”.

Step 7: Go back into your Tines to see the workflow. Check that the Webhook is created with your link. Then check that the A.I. response is summarised as bullet points when emailed.

Step 8: Then put in the send email summary and then log in to powershell as an administrator. You should trigger an alert in Elastic. (see below)

When you expand the details, another window opens.

Step 9: Go to Tines, click “events” tab underneath the Webhook action. You will see the events at the bottom.

Step 10: Check your email for successful automation.

Provide some next action steps for the analyst to take when reviewing this alert. Format this into bullet points to make it easy to read for the email.\n\n"},"body":{"rule_name":"Test Admin Rule","description":"Test Admin Rule"},"headers":{"x_forwarded_for":"34.67.157.192","x_forwarded_proto":"https","x_forwarded_port":"443","host":"fragrant-branch-8988.tines.com"},"x_amzn_trace_id":"Root=1-69186045-17f78c254505a10e3dd51bdf","accept":"application/json, text/plain, */*","user_agent":"axios/1.12.1","accept_encoding":"gzip, compress, deflate, br","traceparent":"00-d8665a2aada465ac284c2a3544e918a5-4b4addab51604357-00","version":"HTTP/1.1","content-type":"application/x-www-form-urlencoded","content-length":"72","request-method":"POST","date":"Sat, 15 Nov 2025 11:13:09 UTC","request_ip":"34.67.157.192"},"response":{"body":{"status":"ok"},"status":"201"},"meta":{"input_tokens":356,"output_tokens":126,"credits_used":1,"remaining_credits":34,"model":"eu.anthropic.claude-3-haiku-20240307-v1:0","duration":1.436688031}}

Summary of What I Learned

- Installed and configured Elastic SIEM, connecting an endpoint agent to ingest logs.
- Created a **detection rule** for failed admin logins.
- Configured Elastic to send triggered alerts to a **Tines webhook**.
- Built a Tines workflow that:
 1. Receives the SIEM alert via webhook.
 2. Passes the alert to an **AI step**, which summarizes the data into plain language.
 3. Sends the summary by **email notification** to SOC analysts.
- Tested by simulating a failed login event and confirmed the full workflow executed end-to-end.

Conclusion: This project proved that automating enrichment and reporting cuts down triage time significantly. In a real SOC, this workflow could reduce response times from minutes to seconds.

Why This Is Important for a SOC Analyst

- **Cuts through the noise:** Alerts are summarized into actionable insights.
- **Speeds up triage:** Analysts can focus on investigation, not data parsing.
- **Prevents missed alerts:** Email notifications ensure important events are not buried in dashboards.
- **Demonstrates forward-thinking:** Shows how AI can support SOC workflows, not replace them.
- **Builds key skills:** Rule writing, automation, webhooks, and AI integration — all critical in modern SOCs.
